

## **Product Technical Bulletin #19**

### **Contact Spring Plating**

AirBorn has introduced a pre-plated version of the engagement spring used on our W-Series socket contacts. A selective plating process reduces the amount of electrodeposited gold in the non-functional areas of the socket while maintaining the required finish in the engagement area as specified by MIL-C-55302. Contact performance and durability is consistent with the previous version of the spring.

This notification is provided to announce the forthcoming variation which has been approved by Defense Electronics Supply Center (DESC) in their letter dated 30 September 1992.
